

Stopper System for more safety

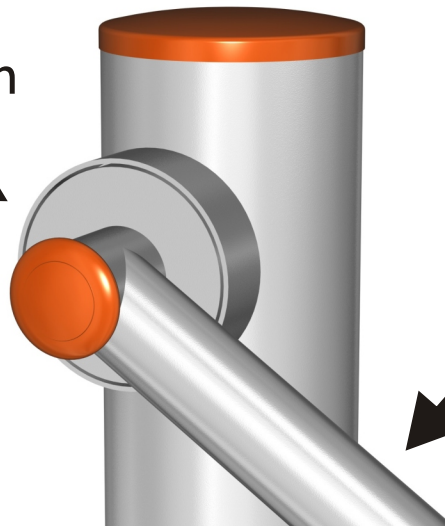

damping prevents
swinging back an forth

no swinging away
when ascending

Stopper System

damped
stop

The TÜV certification requires a limitation of free moving leg levers at 55° on each side. The Stopper System is a special bearing, achieving the necessary limitation. Because of the closed Stopper System, there are no finger crushing zones. Additionally, the movability of levers is damped, this effects a very pleasant motion resistance and enhances the safety.

- lever limitation at 55°
- damped bearing
- slight resistance
- no swinging back and forth
- safe ascending
- pleasant motion feeling
- prevents danger to playing children
- minimizes vandalism
